

This research is funded by the National Science Foundation, National Park Service, and Earthwatch. Based out of Michigan Technological University, Dr. John Vucetich and Dr. Rolf Peterson currently co-direct this ever-evolving study, which will yield answers to exciting questions in the future.

### **Isle Royale**

*The largest island in Lake Superior, Isle Royale is a unique ecosystem that offers relatively easy observation and minimal human impact. Based upon this isolated ecology, researchers have discovered new information about wolves and moose, and the balance of ecosystems.*

*Wolves and Moose of Isle Royale* reveals the unique interrelationships of these two remarkable animals, based upon the longest ongoing predator-prey study in history. Viewers will be spellbound by the spectacular wildlife photographs, the natural history of wolves and moose, their fight for survival, and the findings of this scientific investigation. Maps of their territory, studies of bones, and graphs of research results are interwoven among the stories of life and death of these mysterious creatures.

Discover the details of survival: How much food must a moose eat to be healthy? What are the biggest threats to moose survival? How do wolves kill moose, when moose are 10 times their size?
